DE 70 47 986 Brake motor, in particular for hoisting gear and the like

The brake motor comprises a rotor of the motor which is formed as part of the friction brake. The motor (4, 5; 4', 5'; 104, 105) has the form of a disc motor. It is the object of the invention to provide a brake motor which has the advantages that result from the use of a rotor as part of the brake, but does not have the disadvantages that common brake motors have like noise development caused by vibrations.
